In the Claims

Please amend claims 4, 5, 14, 15 and 17, and add new claims 20-27, as shown below. Please cancel claims 2-14.

- 1. (Original) A method of preparing a xylene product comprising:
 - (a) providing a reactor containing a non-steamed, phosphorus-treated ZSM-5-type zeolite catalyst;
 - (b) contacting the catalyst with a toluene/methanol feed and a cofeed of hydrogen under reactor conditions suitable for the methylation of toluene; and
 - (c) introducing water cofeed into the reactor during the methylation reaction under conditions that provide substantially no structural aluminum loss of the catalyst from such introduction of water.
- 2. (Original) The method of claim 1, wherein:

the cofeed water is introduced with the initial feed.

3. (Original) The method of claim 1, wherein:

the cofeed water is introduced after the toluene methylation reaction has started.

4. (Currently Amended) The method of claim 1, wherein:

the cofeed water is fed into the reactor at from about 0.2 mole to less than about 10 moles water per mole of HC toluene + methanol feed.

5. (Currently Amended) The method of claim 1, wherein:

the cofeed water is fed into the reactor at 0.3 mole to about 7 moles water per mole of HC toluene + methanol feed.

6. (Original) The method of claim 1, wherein:

the reactor has a catalyst bed inlet temperature maintained at less than 700 °C.

7. (Original) The method of claim 1, wherein:

the phosphorus-treated ZSM-5-type zeolite catalyst has a total phosphorus content of from about 0.01 g P/g zeolite to about 0.15 g P/g zeolite.

8. (Original) The method of claim 1, wherein:

the method provides a xylene product having a para-xylene content of at least 80% by total moles of xylene.

9. (Original) The method of claim 1, wherein:

the toluene/methanol feed has a toluene/methanol molar ratio of from about 1:2 to about 10:1.

10. (Original) The method of claim 1, wherein:

the ZSM-5-type zeolite catalyst is treated with at least one of phosphoric acid and ammonium hydrogen phosphate.

11. (Original) The method of claim 1, wherein:

the reactor has a catalyst bed inlet temperature that is maintained from about 400 °C to about 600 °C.

12. (Original) The method of claim 1, wherein:

the catalyst has a silica/alumina mole ratio prior to phosphorus treatment from about 25 to about 300.

13. (Original) The method of claim 1, wherein:

the catalyst is a bound catalyst.

14. (Currently Amended) A method of preparing a xylene product comprising:

providing a fixed-bed reactor containing a <u>non-steamed</u>, phosphorus-treated ZSM-5-type zeolite catalyst having a total phosphorus content of from about 0.01 g P/g zeolite to about 0.15 g P/g zeolite and a silica/alumina mole ratio prior to phosphorus treatment from about 25 to about 300;

contacting the catalyst with a toluene/methanol feed and a cofeed of hydrogen under reactor conditions suitable for the methylation of toluene; and

introducing water into the reactor during the methylation reaction in an amount of from about 0.2 to less than about 10 moles of water per mole hydrocarbons toluene + methanol under conditions that provide substantially no structural aluminum loss of the catalyst from such introduction of water to produce a xylene product having a para-xylene content of at least 80% by total moles of xylene and wherein the catalyst bed inlet temperature is less than 700 °C.

- 15. (Currently Amended) The method of claim 14, wherein:
 - the water is introduced with the initial toluene/methanol HC feed.
- 16. (Original) The method of claim 14, wherein:
 - the water is introduced after the toluene methylation reaction has started.

17. (Currently Amended) The method of claim 14, wherein:

the water is fed into the reactor at a ratio of from about 0.3 to about 7 moles per mole of hydrocarbons toluene + methanol.

18. (Original) The method of claim 14, wherein:

the toluene/methanol feed has a toluene/methanol molar ratio of from about 1:2 to about 10:1.

19. (Original) The method of claim 14, wherein:

the ZSM-5-type zeolite catalyst is treated with at least one of phosphoric acid and ammonium hydrogen phosphate.

20. (Original) The method of claim 14, wherein:

the reactor has a catalyst bed inlet temperature that is maintained from about 400 °C to about 700 °C.

21. (Original) The method of claim 14, wherein:

the catalyst is a bound catalyst.
